## Index

	Page No.
1. Introduction	i-xvii
2. Sample Particulars	1-7
3. Wealth Index	8-9
4. Household Characteristics	10-13
5. Sex Ratio	14-16
6. Effective Literacy Rate	17-18
7. Marriage	19-23
8. Schooling Status	24-27
9. Work Status	28-31
10. Disability	32-34
11. Injury	35-41
12. Acute Illness	42-55
13. Chronic Illness	56-81
14. Personal Habits	82-90
15. Fertility	91-104
16. Abortion	105-110
17. Family Planning Practices	111-119
18. Unmet Need for Family Planning	120-121
19. Ante Natal Care	122-132
20. Delivery Care	133-141
21. Post Natal Care	142-146
22. Janani Suraksha Yojana (JSY)	147-149
23. Immunization, Vitamin A & Iron Supplement and Birth Weight	150-159
24. Childhood Diseases	160-164
25. Breastfeeding and Supplementation	165-175
26. Birth Registration	176-178
27. Awareness	179-182
28. Mortality	183-197
29. Confidence Interval (95%) for some important Indicators	198-203
30. Housing Characteristics	204-217
31. Annexure	218-238

## Introduction

Decentralized district-based health planning is essential in India because of the large inter-district variations. In the absence of vital data at the district level, the State level estimates are being used for formulating district level plans as well as setting the milestones thereof. In the process, the hotspots (districts requiring special attention) very often get masked by the State average. This statistical fallacy compounds the problems of the districts acutely, more so in the health sector. At present, none of the Surveys provides estimates of core vital indicators on fertility and mortality at district level. The District Level Household Survey conducted with periodicity of five years mainly focuses on indicators pertaining to maternal health and child welfare programmes. There has, therefore, been a surge in demand from various quarters, in recent years, to generate timely and reliable statistics at the district level for informed decision making in the health sector.

## Genesis

2. The Annual Health Survey (AHS) was conceived during a meeting of the National Commission of Population held in 2005 under the Chairmanship of the Prime Minister wherein it was decided that “there should be an Annual Health Survey of all districts which could be published / monitored and compared against benchmarks”. The objective was to monitor the performance and outcome of various health interventions of the Government including those under National Rural Health Mission (NRHM) at closer intervals through these benchmark indicators. The AHS has been made an integral part of the NRHM, Ministry of Health & Family Welfare. The responsibility of the project has been entrusted to the Office of the Registrar General, India on behalf of the Ministry of Health & Family Welfare in view its expertise in handling the Sample Registration System, one of the largest demographic surveys in the world.

## Objective

3. Realizing the need for preparing a comprehensive district health profile on key parameters based on a community set up, the AHS has been designed to yield benchmarks of core vital and health indicators at the district level; prevalence of disabilities, injuries, acute and chronic illness and access to health care for identified morbidities; and access to maternal, child health and family planning services. By virtue of being a panel survey, it has the unique ability to map the rate of change in these indicators on a yearly basis. AHS would, thus, enable better capturing of the health seeking behaviour of the public as compared to other periodic cross-sectional surveys, and also help needed corrections in the strategies.

## Coverage

4. The sample size at the district level has been derived taking Infant Mortality Rate as the decisive indicator and host of other practical issues related to execution of the survey. Keeping in view the mammoth size of the sample, it was a conscious decision of the Government to initially confine the survey to the 284 districts (as per 2001 Census) of the 8 Empowered Action Group States (Bihar, Jharkhand, Uttar Pradesh, Uttarakhand, Madhya Pradesh, Chhattisgarh, Odisha and Rajasthan) and Assam for a three year period starting from 2010-11. These 9 high focus States with relatively high fertility and mortality account for about 48 percent of the total population in the country. A representative sample of 20,694 statistically selected Primary Sample Units (PSUs - Census Enumeration Blocks in case of urban areas and villages or a segment thereof in

case of larger villages in rural areas) based on 2001 Census has been drawn from these AHS States which would cover about 18 million population and 3.6 million households each year. However, during the Base-line Survey, a total of 20.1 million population and 4.14 million households have actually been covered. Despite being restricted to 9 States, the AHS is the largest demographic survey in the world and covers two and a half times that of the Sample Registration System.

### **Fieldwork Strategy**

5. The project is being implemented as a hybrid model wherein the actual field work has been outsourced to seven selected Survey Agencies on the pattern of National Family Health Survey (NFHS) and District Level Household Survey (DLHS). The co-ordination, supervision and monitoring of the fieldwork in the States are being carried out by dedicated staff posted at various levels in the respective Directorate of Census Operations (DCOs). The responsibility for overall co-ordination, supervision and monitoring across the nine AHS States rests with the AHS Division of ORGI. For smooth and effective execution of the survey, the AHS States have been divided into 18 mutually exclusive and exhaustive zones, each having a group of contiguous districts with more or less equal workload.

### **Technical Consultation**

6. The outline of the survey such as approach, periodicity, coverage, sampling strategy, sample size, permissible levels of relative standard errors, and levels of aggregation, was finalized after a series of deliberations with the representatives from Ministry of Health & Family Welfare, National Sample Survey Office (NSSO), Central Statistics Office (CSO), Ministry of Woman & Child Development, Indian Council of Medical Research, Planning Commission, International Institute for Population Sciences and other subject experts. Based on the recommendations, various technical details including preparation of sample design, derivation of sample size etc. were worked out and vetted by the Technical Advisory Group (TAG) constituted for the purpose.

### **Sample Design**

7. The Sample design adopted for Annual Health Survey is a uni-stage stratified simple random sample without replacement except in case of larger villages in rural areas (population more than or equal to 2000 as per 2001 Census), wherein a two stage stratified sampling has been applied. The sample units are Census Enumeration Blocks (CEBs) in urban areas and villages in rural areas. In rural areas, the villages have been divided into two strata. Stratum I comprises villages with population less than 2000 and Stratum II contains villages with population 2000 or more. Smaller villages with population less than 200 were excluded from the sampling frame in such a manner that the total population of villages so excluded did not exceed 2 per cent of the total population of the district. In case of Stratum I, the entire village is the sample unit. In case of Stratum II, the village has been divided into mutually exclusive (non-overlapping) and geographically contiguous units comprising group of EBs called segments of more or less equal size and population not exceeding 2000 in any case. One segment from the frame of segments thus prepared was selected in a random manner to represent the selected village at the second stage of sampling.

8. The number of sample villages in each district was allocated between the two strata proportionally to their size (population). The villages within each size stratum were further ordered by the female literacy rate based on the Census 2001 data, and three

disjoint and equal size substrata were established. The sample villages within each substratum were selected by simple random sampling without replacement. Similarly, in urban areas, the Census Enumeration Blocks within a district were ordered by the female literacy rate based on the Census 2001 data, and three disjoint and equal size substrata were established. The sample Census Enumeration Blocks within each substratum were selected by simple random sampling without replacement. Thus, female literacy which has a direct bearing on the fertility behaviour was used for implicit stratification. Further, the process of selection ensured equal representation across three sub-strata both in rural as well as in urban areas of a district besides rendering the sample design as self-weighting.

### Sample Size

9. Generating robust estimates of Infant Mortality Rate at the district level has become an utmost necessity as reduction in Infant Mortality constitutes one of the key targets in the Reproductive & Child Health Programme (RCH) under the umbrella of NRHM. This would also facilitate effective tracking of the Millennium Development Goal 4 on Child Mortality. The Infant Mortality Rate has therefore been taken as the decisive indicator for estimation of sample size at the district level. The permissible level of error has been taken as 10 percentage relative standard error (prse) at the district level. The sample size so worked out would yield relatively better estimates of Crude Birth Rate / Crude Death Rate and may also enable generation of rarer indicators like MMR (for a group of districts) with good precision. In the absence of district level estimates from any other reliable source, the district level derived estimates of IMR based on SRS pooled data have been used for estimation of sample size for each district.

### Sample Identification Work

10. One of the essential prerequisites for the commencement of the survey was to uniquely identify the sample units on ground. This was done in all the sample units across the nine AHS States by the regular staff of ORGI. The work involved firming up of the boundary of the selected villages / Enumeration Blocks; resorting to segmentation in case of villages exceeding the population 2000, random selection of segment thereof and drawing of appropriate notional maps of the sample units to serve as the base map for the survey work.

### Survey Tools

11. The Baseline Survey in all the nine AHS States was carried out during July 2010 to March 2011 and four Schedules, in all, were administered. These are: (i) House-listing Schedule, (ii) Household Schedule, (iii) Woman Schedule and (iv) Mortality Schedule. In the House-listing Schedule, besides the mapping and listing of all the houses and households in a sample unit, some key particulars relating to the housing characteristics (type and ownership), basic amenities available to the household and assets possessed by them were collected. In the Household Schedule, all Usual Residents as on 01.01.2010 were listed and for each listed member, information on background characteristics like Name, Sex, Relationship to Head, Date of Birth, Age, Religion, Social Group, Marital Status, Date at first Marriage, Education and Occupation/Activity Status was captured. Besides, information in respect of Disability, Morbidity (Injuries, Acute Illness, and Chronic Illness) and Personal Habits (like Chewing, Smoking and Consumption of Alcohol) was also collected wherever applicable. Woman Schedule comprised two sections. Section-I was administered to all Ever Married Women (EMW) aged 15-49 years and information relating to the outcome of pregnancy(s) (live birth/still

birth/abortion); birth history; type of medical attention at delivery; details of maternal health care (ante-natal/natal/post-natal); immunization of children; breast feeding practices including supplements; occurrence of child diseases (Pneumonia, Diarrhoea and fever); registration of births, etc. taken place during the reference period i.e. 01.01.2007 to 31.12.2009 was collected. Section II focused on information on pregnancy; use, sources and practices of family planning methods; details relating to future use of contraceptives and unmet need; awareness about RTI/STI, HIV/AIDS, administration of HAF/ORT/ORS during diarrhoea and danger signs of ARI/Pneumonia; and these details were collected from all Currently Married Women aged 15-49 years.

12. Through the Mortality Schedule, details relating to death occurred to usual residents of sample household during 01.01.2007 to 31.12.2009 were captured and it included information on name & sex of deceased, date of death, age at death, registration of death and source of medical attention received before death. For infant deaths, a question on symptoms leading to death was also probed. In case of deaths associated with pregnancy, information on a variety of questions on factors leading/contributing to death, symptoms leading to death, time between onset of complications and death, etc. was asked to yield data on various determinants of maternal mortality. These schedules were finalized after a series of deliberations in the TAG and thereafter piloting in the field situation. The fieldwork in sample units was carried out by teams of field enumerators which had at least one female in each team. This was done to ensure that besides canvassing of woman schedule, questions on morbidity for female members in household schedule and questions relating to infant deaths as well as deaths associated with pregnancy in the mortality schedule were also probed and recorded only by the female enumerator.

### **Training**

13. Since information on morbidity, disability and few specific details in case of infant and maternal deaths etc. were collected at the district level in such a large survey setup for the first time, adequate emphasis was given to training. An exhaustive training manual for the field staff was prepared with inputs from various stakeholders and subject experts. A three day 'Training of Trainers' programme was organized at New Delhi prior to commencement of State/Zone level training sessions wherein experts imparted training on concepts, definitions and how best to collect data on different parameters. A pool of medical doctors was arranged with the help of National Institute of Health & Family Welfare (NIHFW) who imparted training to the field staff on disability and morbidity during State/Zone level training programmes. A standardized Video Training Module was specially developed for the purpose. Officers from ORGI and DCOs were deputed to observe the training programmes conducted at State level by Survey Agencies.

### **Supervision and Third Party Audit**

14. In addition to the multilayer supervision mechanism adopted by the Survey Agencies, regular inspections were carried out by the officers/officials of respective DCOs and those from ORGI headquarters to ensure the data quality. The inspections were a judicious mix of concurrent as well as post survey audit. Over and above, a component of Third Party Audit was included to verify and authenticate the surveyed data through an independent mechanism. The Third Party Audit work was carried out in 20 randomly selected AHS units in each of the districts covering every fourth household thereof by following a standard protocol prescribed by ORGI. Truncated versions of Household, Women and Mortality Schedules were filled in afresh by the field staff of the Third Party

Audit Agencies. The findings in respect of key indicators were matched and re-survey was undertaken by the Survey Agencies in units where the variation was outside the permissible limit. The third party audit also helped in netting of missed vital events, particularly rarer ones like infant and maternal deaths.

### **Dissemination of Results**

15. In view of the large volume of data collected under AHS and significant time required for validation and processing, dissemination of AHS results is done in two phases. The first set of data was released in August 2011 in the form of State-wise bulletins, which contained the district level data on crude birth rate, crude death rate, natural growth rate, infant mortality rate, neo-natal and post neo-natal mortality rates, under 5 mortality rate, sex ratio at birth, sex ratio (0-4 years) and overall sex ratio. In addition, the Maternal Mortality Ratio (MMR), Maternal Mortality Rate and life time risk were released for a group of districts. In order to facilitate direct intervention, the maternal mortality indicators were combined and released for a group of districts on the basis of existing administrative divisions in the respective AHS States.

16. Under the present phase of dissemination, data on host of other important parameters covered in AHS under Household and Woman Schedules are being released in the form of State and District Level Factsheets. Though the sample size has been calculated for the district as a whole, the rural and urban estimates at the district level have also been published as byproduct. Users are advised to keep the above fact into consideration while using the rural / urban estimates of a district. In order to ward off unusual sampling fluctuations, the urban estimates have not been published in respect of some indicators for the districts where the number of urban sample units was less than six. To begin with, number of PSUs, Households, Population, Ever Married Women, Currently Married Women, Children aged 12-23 months (as on date of survey) covered in the sample of each district and the State along with their rural-urban breakup have been given to provide the users requisite insight on the metadata. The indicators contained in the AHS Bulletin have also been reproduced in these Factsheets so that the users may have access to complete set of indicators at one place. However, they may refer to the AHS Bulletin for details on metadata.

### **Wealth Index**

17. A few relevant indicators based on House-listing Schedule, which would help in assessing the economic profile of the households such as, structure of the house where the household is residing, i.e. Pucca/Kachcha; Ownership status of the house, i.e. Owned/Rented; Improved source of drinking water; Treatment of water by the households to make it safer for drinking; Access to toilet facility; Access to electricity; Main Source of lighting; Main source of fuel used for cooking; Availability of kitchen; and Possession of Computer/Telephone/Mobile have also been tabulated. In the absence of income and expenditure measures of economic status, household wealth Index has been constructed at State level for each of the nine study States using the assets possessed and the facilities availed by the households as mentioned above to determine a household's relative economic status and also to assess the differential impact with respect to health outcomes or health service utilization thereof. The technique of Principal Component Analysis (PCA) has been used to determine variable weightings. Similar approach was also followed in NFHS and DLHS Household Wealth Index.

18. The list of variables used for the development of wealth index along with their coding structure is given below:

List of Variables selected for the development of HH Wealth Index	
Assets	Coded Categories
Type of Structure of the House	Pucca House=1 Otherwise=0
Main Source of drinking water	Piped water into dwelling/yard/plot, Public tap/stand pipe, Hand pump, Tube well or bore well , Protected dug well = 1 Otherwise=0
Type of Toilet Facility mainly Used	Flush/Pour Flush Latrine – connected : to piped sewer line /septic tank/ pit latrine/somewhere else, Pit Latrine (Without flush/pour flush): Ventilated improved pit, Pit latrine with slab = 1 Otherwise=0
Household having Electricity	Yes=1, No= 0
Main Source of lighting	Electricity, Solar=1, Otherwise=0
Main Source of Fuel used for Cooking	LPG/PNG, Electricity, Biogas= 1, Otherwise=0
Number of Dwelling rooms exclusively in the possession of household	Household having no dwelling room exclusively in possession = 0, 1 dwelling room exclusively in possession = 1, 2 dwelling rooms exclusively in possession = 2, 3 dwelling rooms exclusively in possession = 3, 4 dwelling rooms exclusively in possession = 4, 5 dwelling rooms exclusively in possession = 5, 6 dwelling rooms exclusively in possession = 6, 7 dwelling rooms exclusively in possession = 7, 8 dwelling rooms exclusively in possession = 8, 9 or more dwelling rooms exclusively in possession=9
Availability of Kitchen	Cooking inside or Outside House - Has Kitchen=1, Otherwise=0
Possession of Radio/Transistor	Yes=1, No= 0
Possession of Television	Yes=1, No= 0
Possession of Computer/Laptop	Computer/Laptop with or without internet connection = 1, No =0
Possession of Telephone/Mobile Phone	Telephone, Mobile Phone or both = 1, No=0
Possession of Washing Machine	Yes=1, No= 0
Possession of Refrigerator	Yes=1, No= 0
Possession of Sewing Machine	Yes=1, No= 0
Possession of Bicycle	Yes=1, No= 0
Possession of Two wheeler (Scooter/Motorcycle/Moped)	Yes=1, No= 0
Possession of Car/Jeep/Van	Yes=1, No= 0
Possession of Tractor	Yes=1, No= 0
Possession of Water Pump/Tube well	Yes=1, No= 0
Possession of Cart (Driven by animal/machine/other)	Cart-Driven by animal/machine/other=1, Doesn't have =0
Land Possessed (in hectares)	No land= 0, Less than 0.02 hectare = 1, 0.02 to less than 1.00 hectare = 49, 1.00 to less than 4.00 hectares = 250, 4.00 to less than 10.00 hectares =700, 10.00 hectares or more=1000

Considering these variables, principal component analysis technique was applied and each of the above household assets/ facilities was assigned a weight or a factor loading. The Asset Scores have then been computed for each single household by using the following formula:

$$\text{HH Asset Score (AS)} = \frac{[\text{Value of Asset Variable} - \text{Mean of Asset Variable}]}{\text{Standard Deviation of Asset Variable}} \times \text{Weight of component I}$$

Subsequently, the Asset Scores of all the variables were added at the household level to get the Total Asset Score for each of the households. Thereafter the households were ranked according to their individual Household Asset Score (HHAS) and then divided into five quintiles with the same number of households in each. This provided the cut off points or the ranges for each quintile. The highest (20%) and the lowest (20%) quintiles have been published for each of the districts in a State to highlight the extreme disparity in the household's relative economic well being. The value of the indicators corresponding to these quintiles is outside the purview of this factsheet and would be presented in State level reports.

### Marriage

19. The information on marital status as on 01.01.2010 was probed in respect of all household members (Usual Residents) irrespective of their age. For those who were married, the date of first marriage was recorded. Using this, age at first marriage, which has a direct impact on child bearing as women marrying early have on an average a longer period of exposure to pregnancy and a greater number of lifetime births, was obtained. Using the age data, the mean age at marriage for males and females has been worked out and included in the Factsheet. The mean age at marriage is based on the marriages to the members of the household (Usual Residents as on 1.1.2010) taken place during 2007-09. The proportion of marriages among males and females taking place below the legal age, i.e., 21 and 18 years respectively, has also been tabulated. Such proportions are also based on the marriages to the members of the household (Usual Residents as on 1.1.2010) taken place during 2007-09. Besides, the percentage of Currently Married Women aged 20-24 years marrying before legal age (18 years) and percentage of Currently Married Men aged 25-29 years marrying before legal age (21 years) have been worked out and presented.

### Disability and Injury

20. The data on any type of disability as on date of survey was collected in respect of all the usual residents. The type of disability included 'mental', 'visual', 'hearing', 'speech', 'loco-motor' and 'multiple'. The prevalence of any type of disability per 1,00,000 population by gender and residence at the district and State levels has been presented in the factsheet. Since it is difficult to capture the type of injury and its severity from lay reporting, an attempt has been made to assess the severity of injury from the type and duration of hospitalization required. This would also provide an assessment of the workload on hospitals / doctors on account of injury. Accordingly, the type of treatment meted to the injury during last one year of the date of survey has been collected. The categories by type of treatment included 'treated in intensive care unit for any time-1, treated as in-patient with stay more than two weeks-2, treated as in-patient with stay one to two weeks-3, treated as in-patient with stay less than one week-4, treated as out-patient-5, treated by traditional healers-6, and treated at home-7'. Based on these

categories, the number of persons injured by type of treatment received per 1,00,000 population, have been categorized into severe (by including categories 1 & 2), major (by including categories 3 & 4) and minor (by including categories 5 & 6) groups. Those treated at home have been excluded from the above categorization and thus from the analysis also.

### Acute Illness

21. On the morbidity front, if any member (usual resident) of the household suffered from any 'acute illness' during last fifteen days prior to the date of survey, the type of illness has been ascertained. Based on this data, persons suffering from acute illness per 1,00,000 population has been presented for a few select diseases like diarrhoea / dysentery; acute respiratory infection & all types of fever and also for any type of acute illness. Besides, the source from where the treatment for the acute illness was taken has also been included. Accordingly, two important indicators, viz., percentage of persons suffering from acute illness and taking treatment from any source and percentage of persons suffering from acute illness and taking treatment from Government source have been presented. The latter gives the share of Government source across all types of sources availed for taking treatment. It may be noted that the entire fieldwork was carried out over a period of six to seven months and in the process, districts were covered at different points of time (i.e., months / seasons). The seasonality effect may be taken note of while interpreting the results.

### Chronic Illness

22. The data in respect of chronic illness has been collected based on the symptoms pertaining to a particular illness persisting for more than one month and also in respect of illnesses where it was diagnosed. For both the cases, the reference period was last one year preceding the date of survey. For ascertaining information on symptoms, a list of symptoms associated with various types of diseases was provided along with a separate category for asymptomatic (i.e., having no symptoms). The asymptomatic included those who were not suffering from any illness as well as those who were suffering but had no symptoms. Using this data, percentage of persons having any kind of symptoms of chronic illness along with their source of treatment has been presented. As regards chronic illnesses diagnosed, this was included to measure the extent to which facilities for diagnosis and treatment of some major chronic illnesses set up by centre/State/local Government / private agencies have been utilized. A list of common chronic diseases and those pertaining to major health intervention programmes was provided. Based on this data, percentage of persons diagnosed for a few important diseases such as diabetes, hypertension, tuberculosis, asthma / chronic respiratory disease and arthritis per 1,00,000 population has been presented besides those diagnosed for any type of chronic illness. Using the data collected on source of diagnosis, status with regard to getting regular treatment and source of treatment, percentage of persons having diagnosed for any kind of chronic illness and getting regular treatment as well as those getting regular treatment from Government source has been worked out and included in the Factsheet. Since the data on morbidity has been elicited as reported by the respondents, it may suffer on account of accuracy. Nevertheless, the availability of such a rich data set at the district level would fill in the much awaited void and pave the way for evidence-based health planning and appropriate interventions.

## Personal Habits

23. During the base-line survey, information on personal habits such as chewing practices, smoking and consumption of alcohol has been collected for all the usual residents of age 15 years and above. Under chewing habits, the information has been separately collected for chewing with and without tobacco. Based on the data, the percentage of population by habit of chewing with and without tobacco, percentage of population by habit of smoking and percentage of population by habit of drinking alcohol, for the usual residents of age 15 years and above, have been presented. Both for smoking and consuming alcohol, the proportion is based on usual as well as occasional smokers / drinkers. The usual smoker is the one who smokes at least once every day and the usual drinker, who drinks at least once every week. The data on disability, morbidity as well as personal habits have been given by residence and sex to capture the differentials. The enumerators were specifically instructed to collect information pertaining to morbidity as well as personal habits from the concerned individuals in privacy and with due sensitivity in order to elicit proper response to the extent possible.

## Fertility

24. The Total Fertility Rate (TFR), which is an age-period fertility rate for a synthetic cohort of women, measures the average number of births a group of women would have by the time they reach 50 years of age if they were to give birth at the current age-specific fertility rates. The TFR is expressed as the average number of births per woman. Under AHS, TFR has been calculated by dividing three years average of all births reported during the reference period, i.e., 2007-09 by all the women in respective age group. The seven five-yearly age-specific fertility rates for all women in the age groups from 15-19 to 45-49 have been added and thereafter multiplied by 5 to yield the TFR. Due to lack of adequate number of births, the TFR by residence could not be worked out and hence is not being published.

25. The distribution of births by birth order is another way to understand the dynamics on spacing of children and level of fertility. In this regard, two key indicators namely, 'percentage of women aged 20-24 reporting birth of order 2 & above' and 'percentage of women reporting birth of order 3 & above' based on last two live births taken place to Ever Married Women aged 15-49 years during the reference period, i.e., 2007-09, have been presented. 'Percentage of Currently Married Women aged 15-49 years with two living children wanting no more children' is one of the most crucial indicators on desire to limit child bearing. While deriving this indicator, sterilized women or their husbands have not been taken into account whereas women who were currently pregnant have been included.

26. Teen-age pregnancy and motherhood is an important subject in the settings where the marriage of girls takes place at very young ages. This is not only important from the fertility perspective but also its consequent implication on the health of the mother and child. Accordingly, 'percentage of women aged 15-19 who were already mothers or pregnant at the time of survey' has been tabulated and it depicts the percentage of women who have begun child bearing among all ever married women aged 15-19 years. The ever married sample denominator for the age group 15-19 years has not been adjusted by the all women factors for the same age group. This factor should be taken into consideration while interpreting the results.

### Median age at first live birth

27. Median age at first live birth of women aged 15-49 years has been presented to reflect the age at which 50 percent of the women have given their first live birth. This indicator covers women of all marital status and ever married sample denominator has been adjusted by the all women factors in this age group. Ever Married Women not yet having first live birth and Never Married Women have been included as a separate category for computation. Median has been calculated from cumulated single year of age percent distributions of age at first birth. Median is linearly interpolated by the age values by which 50 percent or more of the women had a first birth. In order to gauge the same for older women of the same cohort, median age at first live birth for women aged 25-49 years has also been calculated and presented. These two indicators in conjunction would help in comparing the age with regard to entry into parenthood between the two cohorts.

### Birth interval

28. The information on birth interval, which is defined as the length of time between two successive live births, has been collected in respect of last two live births which took place during the reference period, i.e., 2007-09 for birth order 2 & above. Short birth intervals are likely to have adverse bearing on the mother's health as also on the chances of survival of the neonates and infants. In the Indian context, the birth interval of 36 months may be taken as the bare minimum from the perspective of reducing neonatal and infant mortality and also for achieving the requisite nutritional outcomes. The information on percentage of live births taking place after an interval of 36 months has been calculated and presented to provide insight into the pace of child bearing.

### Mean number of children ever born and surviving

29. The number of children ever born and surviving has been collected for all Ever Married Women aged 15-49 years. The survival status has been assessed as on 1.1.2010 (the reference point for the population). The number of children ever born to women provides an estimate of cohort fertility against the period measures of fertility such as the CBR and the TFR. In order to facilitate comparison of completed cohort fertility with the current fertility, the mean number of ever born children to women aged 45-49 years has been calculated and presented. The gap between the two would demonstrate the decline in fertility levels in the recent past.

### Abortion

30. Abortion as an option was probed for all the pregnancies which resulted into any kind of outcome i.e. live birth, still birth, spontaneous and induced abortion during the reference period i.e. 2007-2009. This was followed by a series of questions such as when the abortion had taken place (month & year), month of pregnancy when the abortion had occurred, whether any ANC was received, whether ultrasound was performed before the abortion, the place of abortion and who performed the abortion. Based on these data, various indicators such as percentage of pregnancy(s) to women aged 15-49 years resulting in abortion, percentage of women who received any ANC before abortion, percentage of women who went for ultrasound before abortion, average month of pregnancy at the time of abortion, percentage of abortions performed by skilled health personnel (doctor / nurse / ANM / LHV / trained dai), and abortions which took place in institutions have been tabulated and presented.

## Family Planning Practices

31. The information on awareness as well as the usage in respect of Family Planning Practices was probed from Currently Married Women aged 15-49 years. There were a few women whose marital status as on 1.1.2010 (reference date) was Currently Married but on date of survey, their marital status was widow / divorcee / separated. In such cases, questions on only awareness were probed from them.

## Current usage of Family Planning Methods

32. Currently Married Women aged 15-49 years, who were currently menstruating or who were in lactating status or secondary amenorrhoea as on date of survey, were asked whether they or their husbands are currently using any method(s) of family planning. In other words, those CMW who were currently pregnant or in menopause status or who have undergone hysterectomy or never menstruated were excluded from the sample. The family planning methods included both modern as well as traditional methods. Modern methods included Tubectomy, Vasectomy, Copper-T/IUD, Pills (Daily), Pills (Weekly), Emergency Contraceptive Pill, Condom/Nirodh, etc., while the traditional ones were Contraceptive Herbs, Rhythm/Periodic abstinence, Withdrawal, Lactational Amenorrhoea Method, etc. Accordingly, percentage of CMW reporting use of various types of family planning methods (most used method) has been tabulated. In addition, percentage of CMW using any method (Contraceptive Prevalence Rate), any modern method and any traditional method has also been tabulated. Levels of use of contraceptives provide the most obvious and widely accepted criterion for assessing the success of FP programme.

## Unmet Need for Family Planning

33. The unmet need for Family Planning is a crucial indicator for assessing the future demand for Family Planning services / supplies. Currently Married Women who are not using any method of contraception but who do not want any more children are defined as having an unmet need for limiting and those who are not using contraception but want to wait for two years or more before having another child are defined as having an unmet need for spacing. The sum total of unmet need for limiting and spacing is the unmet need for Family Planning. In order to ensure comparability with DHS Estimates, similar set of questions were probed from CMW aged 15-49 years under AHS also.

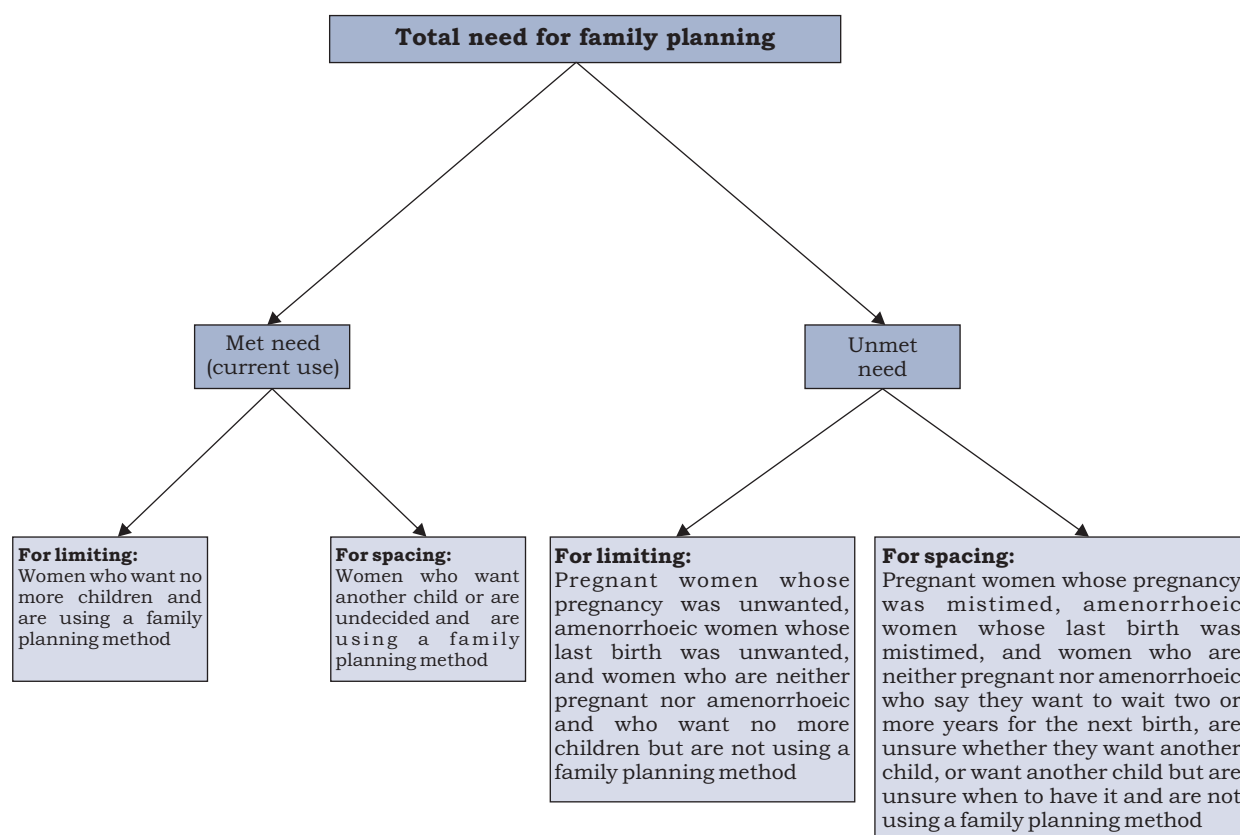

34. For working out the estimates on unmet need, the unmet need for spacing has been calculated as the “proportion of pregnant CMW whose pregnancy was mistimed; CMW in lactational amenorrhoea who are not using any family planning method and whose last birth was mistimed, or whose last birth was unwanted but now they say they want more children; fecund CMW who are neither currently pregnant nor in amenorrhoea, and who are not using any family planning method and say that they want to wait for two or more years for the next birth, including those who say that they are unsure whether they want another child, or want another child but are unsure when to have the birth”.

35. The unmet need for limiting has been worked out as the “proportion of pregnant CMW whose pregnancy was unwanted; CMW in lactational amenorrhoea who are not using any family planning method, whose last child was unwanted and who do not want any more children; and fecund CMW who are neither pregnant nor in amenorrhoea who are not using any method of family planning and who want no more children”. Using the met demand for contraception (current contraceptive users) and the unmet need for contraception, the total demand for family planning as well as the percentage demand

satisfied can be assessed. The classification for the need for family planning is illustrated as under:

### Classification of the need for family planning

### Ante-natal Care

36. Ante-natal care constitutes one of the key elements towards initiatives to promote safe motherhood. A series of questions to capture various aspects of ante-natal care such as, number of ante-natal check-ups received, months of pregnancy at the time of first ANC, main source of ANC, type of tests performed during ANC, number of Tetanus Toxoid (TT) injections received and number of days of consumption of Iron & Folic Acid (IFA) tablets/syrup, were asked from the EMW aged 15-49 years in respect of their last two outcomes of pregnancies which have resulted into live births / still births during the reference period, i.e., 2007-09. However, appropriate indicators based on the above aspects have been tabulated in respect of responses recorded for last live / still births.

37. The indicators included in the Factsheets are percentage of mothers who received any ANC, percentage of mothers who had ANC in first trimester, percentage of mothers who received 3 or more ANC, percentage of mothers who received at least one TT injection, percentage of mothers who consumed IFA for 100 days or more and percentage of mothers who had full ante-natal check-up. The full ante-natal check-up comprises at least three visits for ANC, at least one TT injection received and IFA consumption for 100 days or more. In addition, percentage of mothers who received ANC from Government source, percentage of mothers whose blood pressure & blood (for Hb) were taken and percentage of mothers who underwent ultrasound have been calculated and presented. Besides, percentage of Currently Married Pregnant Women aged 15-49 years registered for ANC has also been presented.

## Delivery Care

38. Under Delivery Care, the details about place of delivery, source of transport provided / availed for reaching the institution, length of stay in the institution after delivery, type of delivery (normal / caesarean / assisted) and the personnel conducting delivery in case of domiciliary births were inquired from the EMW aged 15-49 years for their last two pregnancy outcomes resulting into live births/still births during the reference period, i.e. 2007-09. As in the case of ante-natal care, indicators based on these parameters have been tabulated in respect of responses for last live/still births. Percentage of deliveries taken place in institutions and their distribution into Government and Private institutions; percentage of deliveries taken place at home; percentage of home deliveries conducted by skilled health personnel; and percentage of Safe deliveries are the key indicators presented in the Factsheet. Safe delivery comprises institutional deliveries and home deliveries conducted by doctor/ nurse / ANM / LHV and it does not include those attended by trained dai. However, trained dai is included under skilled health personnel. If the respondent has mentioned more than one person attending delivery, only the most qualified person is taken into consideration.

39. As regards the extent of stay in institutions after delivery which is very crucial and has a direct bearing on the new born care as also on the health of the mother, the percentage of less than 24 hours stay in the institution after delivery has been worked out and presented. Besides, percentage of Caesarean deliveries out of total deliveries taken place in Government and Private Institutions respectively has also been presented.

## Post-natal Care

40. Getting a Post partum / Post-natal check-up soon after the birth of baby or within 48 hours is crucial for the health of both the mother and the child. Accordingly, three indicators, viz., percentage of mothers who received Post-natal check-up within 48 hours of delivery, percentage of mothers who received Post-natal check-up within one week of delivery and percentage of mothers who did not receive any Post-natal check-up have been calculated and presented. In case of institutional delivery where the woman had stayed there for at least 48 hours, it was presumed that the post-natal care was given within 48 hours. These indicators are based on the last outcome of pregnancy which resulted into live / still birth during the reference period, i.e., 2007-09.

41. Along with the first post-natal check-up of mother, check-up of the new borns is essential. It was therefore probed from the mothers, whose last outcome of pregnancy resulted into live birth during the reference period, i.e., 2007-09, when was the new born checked up. Based on this, the percentage of new born who received check up within 24 hours of birth has been worked out and presented. In case of institutional delivery if the baby remained there for at least 24 hours, it was presumed that the first check-up was done within 24 hours.

## Financial assistance under Janani Suraksha Yojana

42. The Janani Suraksha Yojana (JSY) is one of the most important programmes under the overall umbrella of NRHM aimed at reducing Maternal Mortality Ratio and Neo-natal Mortality Rate by promoting institutional deliveries. Under the Scheme, cash incentives are provided to mothers and they are facilitated by Accredited Social Health Activists (ASHAs) to deliver their babies in a health facility. There are also provisions for cost reimbursement for transport and incentives to ASHAs for encouraging mothers to opt for institutional delivery. The scheme is fully sponsored by the Central Government and is

implemented in all States and Union Territories, with special focus on low-performing States. There is also a provision for roping in the private sector by giving accreditation to willing private hospitals/nursing homes for providing delivery services. The Scheme has been implemented in all the 9 AHS States since 2005.

43. In order to gauge the spread and effectiveness of the JSY, Ever Married Women aged 15-49 years were probed whether they had availed the maternity financial assistance for safe motherhood under the scheme in respect of their last two outcomes of delivery resulting in live / still births during the reference period, i.e., 2007-09. The percentage of mothers who availed financial assistance for delivery, percentage of mothers who availed financial assistance for institutional delivery and percentage of mothers who availed financial assistance for Government institutional delivery under JSY, all in respect of the last outcome of delivery resulting in live birth / still birth, have been calculated and presented. Since the scope of JSY has been extended to domiciliary births also, these three sets of indicators would present a holistic picture.

### **Immunization**

44. The information on childhood immunization, i.e., vaccination coverage, has been collected for all living children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09]. Information on six vaccine preventable diseases namely, tuberculosis, diphtheria, whooping cough (Pertussis), tetanus, polio and measles, has been collected with reference to the status as on date of survey. Universal immunization of children against these six diseases is vital for reducing infant and child mortality. Whenever the mother had the vaccination card (Immunization / MCH) and if the card was available at the time of interview, the responses were recorded based on entries in the card. Otherwise, the responses as reported by the mother were noted down. For those living children who did not receive any vaccination, the main reason thereof has also been noted.

45. In conformity with the International and Govt. of India guidelines which specify that children should be fully vaccinated by the time they complete their first year of life, the 12-23 months age group has been chosen for analysis. The percentage of children having Immunization Card, percentage of children aged 12-23 months who have received BCG, percentage of children who have received 3 doses of polio vaccine, percentage of children who have received polio dose at birth, percentage of children who have received three doses of DPT vaccine and percentage of children who have received measles vaccine, all for the age group 12-23 months, have been calculated and presented. Besides the percentage of children aged 12-23 months who have been fully immunized, the percentage of children aged 12-23 months who did not receive any vaccination have also been tabulated in order to portray the complete picture of immunization. According to the WHO guidelines, children are considered fully immunized when they have received vaccination against tuberculosis, three doses of DPT, three doses of the poliomyelitis and one dose of measles.

### **Administration of Vitamin-A and Iron & Folic Acid supplements**

46. Proper and sufficient intake of Vitamin-A and Iron supplements is essential to thwart childhood morbidity and mortality. Vitamin-A is an essential micro nutrient for the immune system and plays an important role in maintaining the epithelial tissues in the body. Severe Vitamin-A deficiency (VAD) can cause eye damage. VAD has also the potential to increase the severity of measles and diarrhoeal diseases in children and slow recovery from illness. Since the human liver can store an adequate amount of the

vitamin for 4-6 months, Vitamin-A dosing every six months is one of the usual methods for ensuring that children at risk are protected from developing VAD. The National Programme on Prevention of Blindness mandates that children of age 9 months to 5 years should be administered oral doses of Vitamin-A every six months. In order to assess the situation, information on children aged 6-35 months who have received at least one dose of Vitamin-A during the last six months has been collected and presented.

47. Anaemia, which is characterised by a low level of haemoglobin in the blood, is a great concern in young children because it can result in impaired cognitive performance, behavioural and motor coordination, language development and scholastic achievement. It also enhances the risk of morbidity from other infectious diseases. One of the most vulnerable groups to anaemia is children aged 6-23 months. It was probed from the mothers of all living children older than 6 months whether IFA tablet / syrup was administered to the children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09] in the last 3 months. IFA tablet/syrup as supplements is given to child beyond six months to prevent anaemia. Based on this, the percentage of children aged 6-35 months who have received IFA tablets / syrup during last three months has been calculated and presented.

### **Birth weight**

48. Birth weight is an important indicator to measure the vulnerability of a new born to the risk of childhood illness and chances of survival. The information on birth weight assists in monitoring programmes to reduce neo-natal and infant mortality through a reduction in low birth weight infants. The information on birth weight has been collected in respect of all living children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09]. Based on this data, the percentage of children whose birth weight was taken and percentage of children whose birth weight was less than 2.5 Kg. have been worked out and presented.

### **Childhood diseases**

49. Treatment practices and contact with health services among children with the 3 most important childhood illnesses namely, Acute Respiratory Infection (ARI), Fever and Diarrhoea, help in the assessment of National Programmes aimed at reducing the mortality impact of these illnesses. The information on children suffering from Acute Respiratory Infection, Fever and Diarrhoea in respect of all the living children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09] during fifteen days preceding the date of survey has been collected. This has been done to minimise the recall lapse. Besides the prevalence, the information on treatment of ARI with antibiotics, treatment of fever and the treatment of diarrhoea with Home Available Fluids (HAF) / fluids prepared from ORS packet has been collected. The treatment of diarrhoeal diseases with Oral Rehydration Therapy (ORT) aids in the assessment of programmes that recommends such treatment. Based on these data, the percentage of children suffering from Diarrhoea and received HAF / ORS / ORT, percentage of children suffering from ARI and sought treatment, and percentage of children suffering from fever and sought treatment have been calculated and presented.

### **Child feeding practices**

50. Early breastfeeding practices determine the successful establishment and duration of breastfeeding. It is recommended that children be put to the breast immediately or within one hour of birth. There is growing evidence of the benefits to mother and child of

early initiation of breastfeeding preferably in the first hour of the birth. Early initiation of breastfeeding contributes to reducing neo-natal mortality. It ensures early skin to skin contact which is important in preventing hypothermia and establishing the bond between the mother and her child. Early initiation of breastfeeding also reduces the mother's risk of post partum haemorrhage, one of the leading causes of maternal mortality. Although breastfeeding is nearly universal in India, very few children are put to breastfeed immediately after birth. In order to have an assessment with regard to the time of initiation of breastfeeding, the mothers of all living children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09] were asked when did they first breastfeed their baby. Based on this, the percentage of children breastfed within one hour of birth has been calculated and presented.

51. Exclusive breastfeeding for the first six months of the child's life is an essential component of the optimal infant and young child feeding practices. The Government of India recommends that children should be exclusively breastfed for the first six months of life (i.e., the child should be given only breast milk and nothing else, not even water). In order to assess the situation on ground, the mothers of all living children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09] were asked how many days/months did they exclusively breastfeed their baby. Based on the responses, percentage of children aged 6-35 months exclusively breastfed for at least six months has been worked out and presented.

### **Complementary feeding**

52. The introduction of complementary feeding at six months of age, solid and semi-solid food and the diverse food combinations fed to children also constitute part of the optimal feeding practices. The purpose of complementary feeding is to complement the breast milk and sustain the growth and development of the child. WHO recommends introduction of solid or semi-solid foods to infants around the age of 6 months because by that age, breast milk by itself is no longer sufficient to maintain the child's optimal growth. Information on supplementation was obtained by asking mothers of all living children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09] at what age did they start feeding the baby food other than breast milk. The type of food included water, animal milk / formula milk, semi-solid mashed food, solid (adult) food and vegetables/fruits. Based on these, the percentage of children who received foods other than breast milk such as water, animal/formula milk, semi-solid mashed food, solid (adult) food and vegetables/fruits during first six months has been worked out and presented. Besides, the average month by which children received these foods have also been worked out and presented.

### **Birth Registration**

53. India, being a signatory to the UN Convention on the Rights of the Child, 1989 which recognizes birth registration as one of the first rights of child, is committed to achieve universalization of birth registration. In India, registration of birth is compulsory under the Registration of Births and Deaths (RBD) Act, 1969. The Act mandates that every birth should be registered and a birth certificate provided free of charge to the informant. Despite significant efforts to improve the Civil Registration System, especially during the past decade, the overall level of registration of births still falls short by about 25 percent. The registration system in the country functions at different levels of efficiency across States/UTs. In order to assess the functioning of the Civil Registration System in the community, information on whether the birth of the baby was registered

with the civil authority and if so, the birth certificate was received or not in respect of all living children [last two outcomes of pregnancy(s) resulting in live births during reference period, i.e., 2007-09] has been collected. Based on this, the percentage of children whose births were registered and the percentage of children whose births were registered & who also received the Birth Certificates have been arrived at and presented.

54. Under the RBD Act, the institutions where birth takes place is to register the birth and issue the birth certificate in case they have been declared as the registration units or to report the event to the local Registrar of Births & Deaths. Of late, majority of the Government institutions have been declared as registration units. Since a review of the system across different States/UTs has revealed that due to lack of a proper and complete reporting system, the institutional births which have already been registered are not being reflected in the final figures compiled and therefore in order to net all such cases, it was presumed that the birth would have been registered. However, even in these cases it was probed whether the birth certificate has been received.

55. This Factsheet pertains to the State of Uttar Pradesh. The field work for the AHS has been carried out by M/s. GfK-MODE Pvt. Ltd., New Delhi, EPOS Health (India) Pvt. Ltd., Gurgaon and M/s. Academy of Management Studies, Lucknow in the allotted zones. The third party audit work in the State has been done by M/s. TALEEM Research Foundation, Ahmedabad.

## Section I – Ever Married Woman (Aged 15–49 years)

SI.No., Name, Identification Code, Age and Marital Status to be copied from Col. 1, 2, 6, 9 &amp; 12 respectively of Household Schedule

Sl.No.	Name	Identification Code				Age	Marital Status (Code) *

\*\* If Code 2 (Married but, Gauna not Performed), Go to Section II of the Schedule.

Q. No.	Questions and Codes	Responses									
Q.1	Have you delivered a live baby before 01.01.2010?	Yes-1, No-2 <input type="checkbox"/> If code '2', go to Q.4									
Q.2	How many children have been born alive ever before 01.01.2010 and out of them how many are surviving as on 01.01.2010?	Record the number <table border="1"> <tr> <th>Male</th><th>Female</th><th>Total</th></tr> <tr> <td></td><td></td><td></td></tr> <tr> <td></td><td></td><td></td></tr> </table> Born Alive Surviving	Male	Female	Total						
Male	Female	Total									
Q.3	What was your age at first live birth ? (in completed years)	<input type="text"/> <input type="text"/>									
Q.4	Has the outcome of any pregnancy(s) resulted in live birth/still birth/abortion during 01.01.2007 to 31.12.2009?	Yes-1, No-2 <input type="checkbox"/> If code '2', go to Section II of the Schedule									

Q.5

If code 1 in Q.4, record the history of outcome(s) of pregnancy(s). Start with the last pregnancy excluding the current one. Use separate lines for twins/triplets. Same pregnancy no. to be recorded for twins/triplets.

Pregnancy Number (to be recorded)	Outcome of Pregnancy		To be filled for Induced or Spontaneous abortions (Code '3' or '4' in Col. 2)						
			In which month & year, you had abortion?	At what month of pregnancy did abortion happen?	Did you receive any ANC? (Yes-1, No-2)	Did you go for ultrasound before this abortion? (Yes-1, No-2)	Where was the abortion performed/ completed? (Code)	Who performed/ completed the abortion? (Code)	For induced abortion only Why did you abort the pregnancy? (Code)
1	2		3	4	5	6	7	8	9
(.....) Last pregnancy	Live Birth-1 Still Birth-2 Induced Abr.-3 Spont Abr.-4	<input type="checkbox"/>	Month <input type="text"/> Year <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
(.....) Previous to last pregnancy	Live Birth-1 Still Birth-2 Induced Abr.-3 Spont Abr.-4	<input type="checkbox"/>	Month <input type="text"/> Year <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
(.....) Second from last pregnancy	Live Birth-1 Still Birth-2 Induced Abr.-3 Spont Abr.-4	<input type="checkbox"/>	Month <input type="text"/> Year <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
(.....) Third from last pregnancy	Live Birth-1 Still Birth-2 Induced Abr.-3 Spont Abr.-4	<input type="checkbox"/>	Month <input type="text"/> Year <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

**Note:** If outcome(s) of pregnancy(s) resulted in 'only' Abortion(s), go to Section-II of Schedule after filling Columns 3 to 9 of Q.5.

Uttar Pradesh: Coverage along the continuum of care

The responsibility for the correctness of internal details rests with the publisher.

The territorial waters of India extend into the sea to a distance of twelve nautical miles measured from the appropriate base line.

The external boundaries and coastlines of India agree with the Record/Master Copy certified by Survey of India.

The state boundaries between Uttarakhand & Uttar Pradesh, Bihar & Jharkhand and Chhattisgarh & Madhya Pradesh have not been verified by the Governments concerned.

The administrative headquarters of Chandigarh, Haryana and Punjab are at Chandigarh.

The interstate boundaries amongst Arunachal Pradesh, Assam and Meghalaya shown on the map are as interpreted from the North-Eastern Areas (Reorganisation) Act, 1971, but have yet to be verified.
